

Practice Set: 20 Questions

Use these questions to review the full Python refresher sequence.

1. Create two variables, `a = 9` and `b = 40`, then write an expression to add them.
2. What is the output of `type(123)` and `type("123")` ?
3. If `ab = "2345"` and `cd = "3253"`, what happens when you write `ab + cd` ?
4. How do you convert `ab` and `cd` to integers before adding them?
5. If `name = "sahil"`, what does `name.lower()` return?
6. What does `name.count("a")` return for `name = "sahil"` ?
7. What is the result of `len("Python")` ?
8. What does `"Notebook"[0:3]` return?
9. What does `"Python"[1:-1]` return?
10. Evaluate `11 // 2` and `11 % 2`.
11. What is the value of `2 ** 3 ** 2` ?
12. What is the result of `10 + 2 * 3`, and why?
13. If `a = 45` and `b = 4`, what are the results of `a > b` and `a == b` ?
14. If `b1 = True` and `b2 = False`, what do `not(b1)`, `b1` and `b2`, and `b1 or b2` return?
15. What does `input()` return by default in Python?
16. Write a small program that takes two integer inputs and prints their sum.
17. Write an `if-elif-else` block that prints whether a number is positive, negative, or zero.
18. What is the difference between `if-elif-else` and `match-case` ?
19. Write a `match-case` function that returns the message for HTTP status code `404`.
20. Use an f-string to print `Python` left-aligned, right-aligned, and center-aligned in a field of width 10.
